

Euro-Office and Nextcloud on Kubernetes (Proposal)

Jan

August 5, 2026

reference URL's : <https://github.com/nextcloud/helm/tree/main/charts/nextcloud> <https://github.com/Euro-Office/Kubernetes-Docs>

Integrating **Euro-Office** with **Nextcloud** on Kubernetes involves deploying two main components onto your cluster and connecting them via the Euro-Office integration app:

1. **Euro-Office Docs (Document Server)**: Renders and edits documents (DOCX, XLSX, PPTX, ODF). Deployed via the Euro-Office Kubernetes-Docs Helm Chart.
2. **Nextcloud**: Manages files, storage, authentication, and user permissions. Deployed via the Nextcloud Helm Chart.

Prerequisites

- A running Kubernetes cluster.
- **Helm v3** installed locally.
- An **Ingress Controller** (e.g., **ingress-nginx**) with TLS/Cert-Manager configured.
- Two domain names/subdomains pointing to your cluster ingress:
- `nextcloud.example.com` (for Nextcloud)
- `office.example.com` (for Euro-Office Docs)

Step 1: Deploy Euro-Office Docs

Euro-Office Docs requires message queues (RabbitMQ), cache (Redis), and a relational database (PostgreSQL/MariaDB) to function.

1. **Add Helm Repository** Add the official Euro-Office Helm repository:

```
helm repo add euro-office https://download.euro-office.com/charts/stable
helm repo update
```

(Alternatively, you can clone the repository directly from Euro-Office/Kubernetes-Docs.)

2. **Create standard values-eurooffice.yaml** Create a custom configuration file for Euro-Office Docs:

```
# values-eurooffice.yaml
ingress:
  enabled: true
  ingressClassName: nginx
  annotations:
    cert-manager.io/cluster-issuer: "letsencrypt-prod"
    nginx.ingress.kubernetes.io/proxy-body-size: "100m"
  hosts:
    - host: office.example.com
      paths:
        - path: /
          pathType: Prefix
  tls:
    - secretName: office-tls
      hosts:
        - office.example.com

# Enable JWT security token between Nextcloud and Euro-Office
jwt:
  enabled: true
  secret: "YourStrongJWTSecretKey"
  header: "Authorization"

# Enable built-in dependencies or point to external state stores
rabbitmq:
  enabled: true
redis:
  enabled: true
postgresql:
  enabled: true
```

3. Install Euro-Office Docs If you have a commercial license, create the Kubernetes secret first:

```
# Optional: if you have a license file
kubectl create secret generic euro-office-license --from-file=license.lic
```

Deploy the chart using Helm:

```
helm install euro-office euro-office/docs \
  --namespace office --create-namespace \
  -f values-eurooffice.yaml
```

Step 2: Deploy Nextcloud

Next, deploy Nextcloud using the official Nextcloud Helm chart.

1. Add Nextcloud Helm Repository

```
helm repo add nextcloud https://nextcloud.github.io/helm/
helm repo update
```

2. Create values-nextcloud.yaml Configure Nextcloud to run behind Ingress and automatically install/enable the eurooffice integration app on startup:

```
# values-nextcloud.yaml
ingress:
  enabled: true
  className: nginx
  annotations:
    cert-manager.io/cluster-issuer: "letsencrypt-prod"
    nginx.ingress.kubernetes.io/proxy-body-size: "512m"
  hosts:
    - host: nextcloud.example.com
      paths:
        - path: /
          pathType: Prefix
  tls:
    - secretName: nextcloud-tls
      hosts:
        - nextcloud.example.com

nextcloud:
  host: nextcloud.example.com
  username: admin
  password: "YourAdminPassword"

# Automatically download and install Euro-Office app upon initialization
defaultApps:
  - eurooffice

persistence:
  enabled: true
  size: 50Gi
```

3. Install Nextcloud Deploy Nextcloud into its namespace:

```
helm install nextcloud nextcloud/nextcloud \
  --namespace nextcloud --create-namespace \
  -f values-nextcloud.yaml
```

Step 3: Connect Nextcloud to Euro-Office

Once both pods are up and healthy, you must configure the Euro-Office connector app inside Nextcloud to talk to the Euro-Office Document Server.

Method A: Using Nextcloud occ CLI (Recommended for Automation) Execute the occ command directly inside the running Nextcloud pod:

1. Enable the Euro-Office app (if not automatically enabled)

```
kubectl exec -n nextcloud -it deployment/nextcloud -- sudo -u www-data php occ app:enable eurooffice
```

2. Set the Euro-Office Document Server URL

```
kubectl exec -n nextcloud -it deployment/nextcloud -- sudo -u www-data php occ config:app:set eurooffice document_server_url https://office.example.com/
```

3. Set the JWT secret (matching the secret in step 1.2)

```
kubectl exec -n nextcloud -it deployment/nextcloud -- sudo -u www-data php occ config:app:set eurooffice jwt_secret YourStrongJWTSecretKey
```

4. Set the JWT header name

```
kubectl exec -n nextcloud -it deployment/nextcloud -- sudo -u www-data php occ config:app:set eurooffice jwt_header_name X-Nextcloud-Auth
```

Method B: Via Nextcloud Web UI

1. Log in to your Nextcloud instance at [<https://nextcloud.example.com>] (<https://nextcloud.example.com>) as an administrator.
 2. Go to **Apps** and verify that **Euro-Office** is downloaded and enabled.
 3. Go to **Administration Settings** -> **Euro-Office**.
 4. Enter the **Euro-Office Document Server Address**: [<https://office.example.com/>] (<https://office.example.com/>)
 5. Under **Secret key**, enter YourStrongJWTSecretKey.
 6. Click **Save**.
-

Step 4: Verification

1. Go to Nextcloud **Files**.
2. Click the + icon and create a new **New Document** (.docx), **Spreadsheet** (.xlsx), or **Presentation** (.pptx).
3. Open the file. It should launch the Euro-Office web-editor interface in your browser.
4. Test editing concurrently in two separate tabs/browsers to confirm real-time collaborative editing.
